Named Routes

Use the `as:` hash key to designated a *name* for a route.

```ruby
# config/routes.rb
MyApp::Application.routes.draw do

  get '/products', controller: 'products', action: 'index', as: 'product_catalog'

end
```
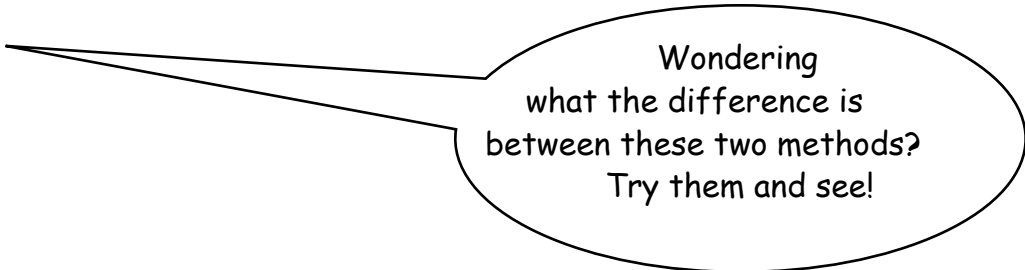

Rails will and write two methods you can use whenever you need "`/products`":

`product_catalog_url`

`product_catalog_path`

Wondering
what the difference is
between these two methods?
Try them and see!
